

**What is  
Datadot ?**

**Datadot is a forensic technology that is used to mark complete vehicles with 10 000 micro chips. These are impossible to remove and simplifies tracing of and prosecution in stolen and hijacked vehicles**

**Why must your  
vehicle have  
Datadot?**

- Transponder keys present major problems to vehicle syndicates – they have to take modern vehicles **with the keys!**
- To get the keys criminals wait for their victim to return to their vehicle
- That is why hijacking of modern vehicles takes place whilst older vehicles are still stolen
- Datadot complicates the processes to convert an illegal vehicle into cash, forcing criminals to avoid such vehicles
- Datadot is thus the only system that actually prevents armed robbery! It's all about personal safety!

**How does it  
work?**

- Each vehicle comes from the factory with an official factory mark known as the VIN (Vehicle Identification Number)
- For decades the main activity of vehicle syndicates always revolved around changing, cutting out or tampering in some way with the VIN – without exception.
- Datadot provides your vehicle with literally 10 000 **virtually invisible** VINS . Criminals, having very little time, cannot change, cut out or tamper with 10 000 micro dots. They simply cannot do it!
- The Datadot stickers on the small windows, sends out a clear message to criminals: **This vehicle is going to get complicated!**

**What does it  
cost?**
